Infratex direct B2B sales appendix

Client and SDR execution brief • 7 October 2026 • Prepared by Growency

Append this document to the Infratex client and SDR brief. It adds a direct B2B motion alongside the financial software, insurance software and implementation partner campaigns.

The strategy in one sentence

Sell businesses a completed document workflow that reduces manual work, with Infratex extraction powering the workflow behind the scenes.

In the financial software campaign, the customer builds its own application around Infratex. In this direct B2B campaign, the customer buys a business outcome: invoices checked, exceptions routed to a person, and approved data passed into its existing system. The delivery team must supply the missing workflow and integration.

Where to start

Start with manufacturers and distributors that receive varied supplier invoices and manually check or enter them into an ERP or accounting system. This is a proposed starting segment to test, not a proven source of conversion or profit.

Keep the first offer narrow: supplier invoice validation and approved ERP entry. Reuse the same workflow across similar customers before expanding into other document types or industries.

Segment	Example finished workflow	Campaign priority
Manufacturing and distribution	Extract supplier invoice data, check agreed fields and references, route exceptions, prepare approved ERP entries.	First test
Logistics	Connect invoices with shipment references and supporting documents, flag missing or mismatched information.	Second test after delivery is repeatable
Lenders	Extract application documents, check completeness, prepare a structured file for an employee to review.	Conditional on delivery and data readiness
Clinics and hospitals	Process supplier invoices or another narrowly defined administrative document workflow.	Conditional on delivery and data readiness

What the customer is buying

The offer is a working process with an owner, clear rules and a destination system. An extraction API alone does not complete that process for this buyer.

All workflow packages in this appendix are proposed offers. Infratex must confirm which functions already exist, which require implementation, and who will deliver and support them before an SDR promises a demo, integration, timeline or price.

1 Define the offer and the buyer

The initial invoice workflow

- Receive invoices through one agreed channel, such as an upload or a supported inbox connection.
- Extract agreed fields, such as supplier, invoice number, dates, totals, tax and line items.
- Check those fields against agreed rules and available business records. Purchase order or goods receipt matching requires access to those records; it cannot be inferred from the invoice alone.
- Flag missing fields, possible duplicates and mismatches for an employee to review.
- Prepare an export or supported system entry after approval, with the agreed status and record of changes.

Scope the pilot to one process and one destination system. Confirm tax rules, tolerances, source records and exception handling with the customer. Keep payment release outside the initial offer.

Who SDRs should contact

The first contact should own the manual process: finance controller, head of finance, accounts payable manager or operations manager. Use the title that fits the business, rather than contacting every department.

The budget owner may be the CFO, finance director or business owner. Bring the ERP, IT or systems owner into the evaluation before committing to an integration. A positive reply from finance is useful; access to the process owner and technical owner makes the opportunity actionable.

What makes an account worth contacting

- It receives documents from multiple suppliers or customers, with varied formats.
- People still review, reconcile or rekey data between documents and business systems.
- The process happens frequently enough for saved time or fewer corrections to justify implementation and ongoing fees.
- There is an identifiable owner and an accessible destination system.
- The workflow is similar enough to the initial offer that delivery can be reused.

Use public evidence to establish relevance, such as manufacturing activity, supplier operations or an ERP role being advertised. These signals do not prove a manual document problem. Ask about the process in outreach instead of inventing pain or volume.

Accounts to deprioritise

Deprioritise businesses with occasional documents, a satisfactory existing solution, no accessible system or no owner willing to change the process. Also deprioritise opportunities that demand extensive bespoke work before a narrow pilot is possible.

The first meeting offer

Offer a short workflow assessment: understand the current process, identify one useful automation step, and decide whether a controlled pilot is justified. Use a verified example workflow in the meeting. Offer to test customer documents only after the client confirms how it will handle those documents and deliver the test.

2 SDR positioning and outreach

The message

Lead with the task the buyer recognises: checking invoices and moving approved information into its ERP. Explain extraction only when it helps answer how the workflow works.

Describe what can be evaluated, without promising savings or accuracy before testing. Avoid claiming that the prospect has a problem, that a named ERP is already supported, or that the workflow can run without review.

Email 1 on working day 1

Subject: Supplier invoice checks at [Company]

Hi [First name],

[One short, verified observation that explains why this company is relevant.]

When supplier invoices arrive, does your team still check them and enter the approved details into [verified system name, or “your accounting system”] manually?

We’re working with Infratex on a workflow that reads the invoice, flags agreed exceptions and prepares approved data for the next step in your system.

Would a 15 minute conversation about your current process be useful?

[Sender name]

Email 2 on working day 4

Subject: Re: Supplier invoice checks at [Company]

Hi [First name],

The starting point would be one invoice process: extract the fields your team needs, check them against agreed records and rules, then send exceptions to a person for approval.

Is invoice checking or rekeying something your team would like to reduce, or is the current process already working well?

[Sender name]

Email 3 on working day 9

Subject: Re: Supplier invoice checks at [Company]

Hi [First name],

I’ll close the loop here. If supplier invoice handling is a current priority, we can map one workflow and see whether a small pilot makes sense.

If someone else owns this process, would you point me to them?

[Sender name]

Stop the sequence after a reply and follow the original brief’s sending, opt-out and suppression process. Use the Infratex delivery team’s approved description of the offer before launch.

Reply handling

“We already have an ERP”: Ask whether document checks and entry are already automated within it, or whether a manual step remains. Position the offer around that specific remaining step.

“We already use OCR”: Ask what happens after extraction and whether exceptions still create work. Do not propose replacement unless the current process has a measurable gap.

“What does it cost”: Explain that implementation and ongoing pricing depend on document volume, rules and system access. Gather those facts and have the client quote; do not invent a starting price.

“Send information”: Send the approved workflow summary and ask which process or system is relevant. An information request alone does not qualify the lead.

3 Qualify the opportunity and prove value

Discovery questions

- What document process are we discussing, and who owns it?
- How many documents and pages arrive each month? How much does volume vary?
- What do employees do from receipt to completion, and where do they spend time?
- Which fields, source records and business rules must be checked?
- Which errors or exceptions occur, and what happens when they do?
- Where must approved information go? Who can confirm system access?
- What outcome would justify paying for a change, and who approves that spend?
- What timing, data handling requirements or delivery constraints matter?

A qualified meeting needs a specific recurring workflow, acknowledged pain, a process owner and plausible value. Record unknowns as unknowns. A meeting becomes a pilot opportunity when the client confirms a feasible scope, technical access, an evaluation owner and agreed success criteria.

SDR handoff record

Record company and contacts; workflow and document types; monthly volume; current manual steps and time estimate; source and destination systems; exceptions; stated desired outcome; budget owner; timing; data requirements; and the next agreed action. Separate what the prospect said from SDR assumptions.

Pilot design

Choose one workflow, one destination and a representative document sample. Include ordinary documents and difficult cases such as missing references, duplicates or varied layouts. Keep a separate evaluation sample so configuring against a few examples is not mistaken for reliable performance.

Map the current process before building. Agree which checks the system performs, which decisions remain with employees, what happens on failure and how the workflow can be stopped. Use a sandbox or reviewed export before any production posting, where feasible.

Agree success before starting

- Field quality: measure the agreed fields against customer-reviewed reference answers.
- Validation: check whether agreed mismatches and exceptions are correctly flagged.
- Work saved: compare total handling time, including review and correction, against the current process.
- System delivery: verify that approved records reach the destination correctly and are not duplicated on retry.
- Operations: confirm the customer can review exceptions, correct results and identify failed items.
- Economics: compare credible monthly value with implementation, usage and support costs.

The customer and delivery team set numerical acceptance thresholds before the pilot. SDRs must not promise a universal accuracy rate or a savings percentage.

A simple value calculation

Estimated monthly labour value equals documents per month multiplied by net minutes saved per document, divided by 60, multiplied by the customer’s loaded hourly cost. Use measured net time savings after review and correction. Treat error-related benefits separately unless the customer can substantiate them.

A successful test should lead to a scoped paid rollout with an owner and support arrangement. Good extraction results alone are insufficient if the workflow cannot be integrated or operated economically.

4 Delivery ownership and campaign execution

Make the offer commercially sustainable

Separate implementation work from recurring service costs. Price system access, workflow configuration, testing and onboarding explicitly. Define document or page usage, support scope and how changes to rules or integrations are charged. Infratex approves all commercial terms.

Assess contribution after extraction costs, implementation labour and continuing support. A large contract can be unattractive if every customer requires a different integration and repeated manual intervention. Prefer a repeatable workflow that the team can support predictably.

Who owns what

Owner	Responsibility	Required output
Infratex commercial lead	Approve scope, claims, pricing and whether an opportunity is worth pursuing.	Approved offer and quote
Infratex technical team or named delivery partner	Build and test the workflow, confirm system access, estimate effort and support it.	Feasible scope and delivery owner
Growency and SDRs	Research accounts, contact process owners, qualify replies and maintain handoff records.	Qualified held meetings
Customer process and systems owners	Supply rules and evaluation data, validate results, approve access and own adoption.	Agreed acceptance and rollout owner

If a partner supplies the workflow, name that partner and agree commercial and support responsibilities before selling the package. The buyer must know who delivers the finished process.

First campaign test

Launch a separate cohort of 25 to 50 researched manufacturing or distribution accounts. Use one workflow offer and contact one relevant process owner per account initially. Tag it as direct B2B so its results can be compared with the existing campaigns. Retain the original three campaigns as separate motions.

Log positive replies, booked meetings, qualified held meetings, pilot opportunities, paid pilots, rollouts and reasons for rejection. Define a positive reply as expressed interest, a relevant question or a useful referral; exclude automatic replies and unsubscribe requests. Judge commercial progress by qualified meetings and paid outcomes as well as reply rate.

Review the first conversations before expanding the list. Repeated questions about the same system or rule can guide a reusable package. Repeated requests for unrelated custom applications suggest that targeting or offer scope needs adjustment.

Conditions for launch and expansion

- Approve the exact workflow description and a demonstrable example.
- Confirm delivery capacity, supported system access and how customer data will be handled.
- Prepare a short discovery sheet, pilot scope and quote process.
- Confirm the owner for failures, exceptions and ongoing customer support.
- Expand after multiple accounts demonstrate the same need and the delivery team confirms a repeatable, economically viable solution.

Logistics is a subsequent test of another specific workflow. Lenders and healthcare require a separately scoped offer and confirmed data and delivery readiness. Initial lender workflows support document preparation and employee review; healthcare workflows support administration. Credit decisions and clinical decisions are outside this initial campaign.

The direct B2B proposition is: help the customer complete a document-driven task. Every campaign promise should connect to a workflow the delivery team can actually supply.
